

# CSC417/2549

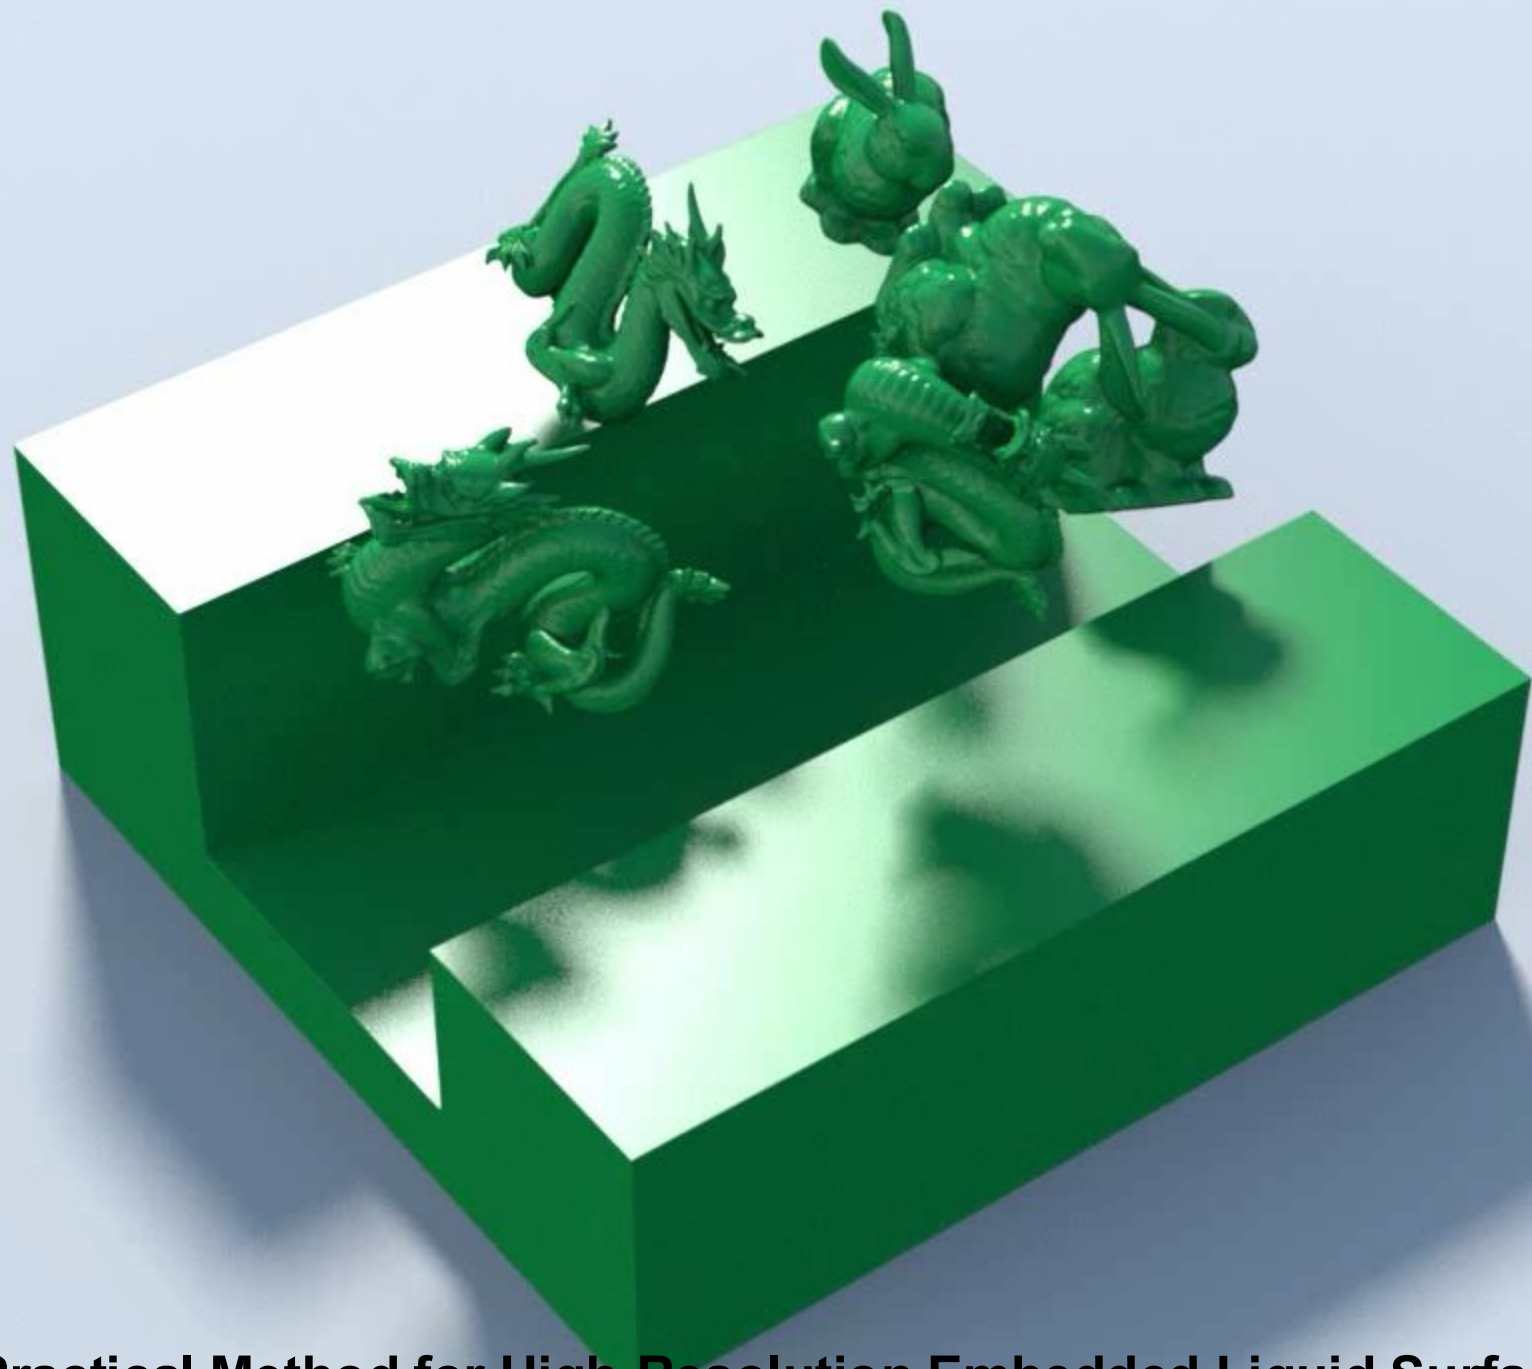

# Physics-Based Animation

... starting at 11:10am

Eulerian-on-Lagrangian Simulation | with Fan, Litven and Pai

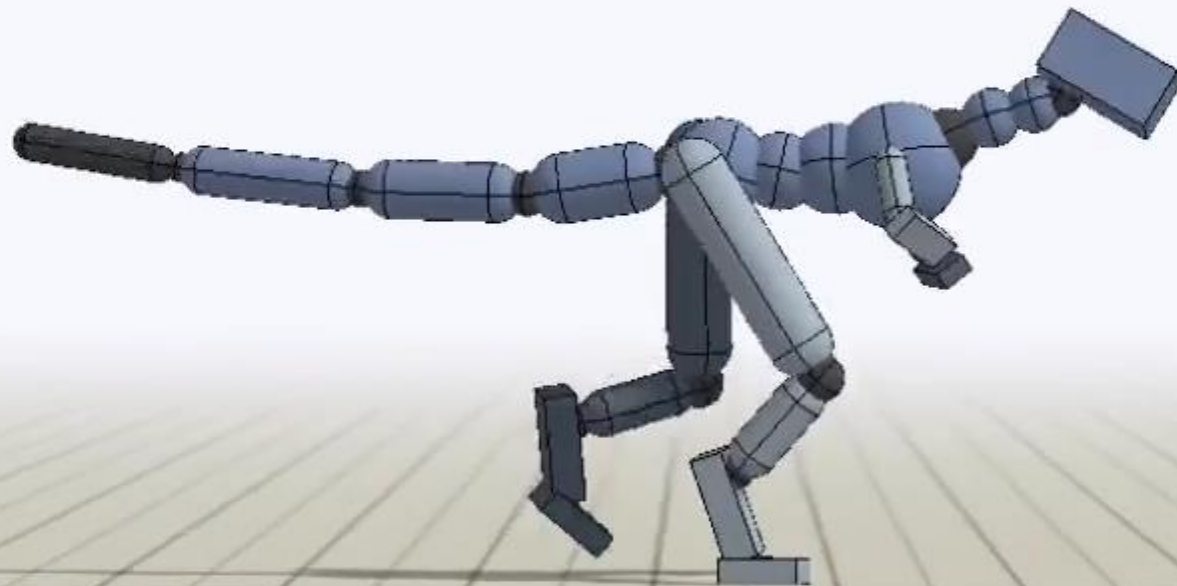

**A Practical Method for High-Resolution Embedded Liquid Surfaces | Goldade et al**

# T-Rex: Walk

Simulated Character

**DeepMimic: Example-Guided Deep Reinforcement Learning of Physics-Based Character Skills**  
| Peng et al.

# The Tools of the Trade

Linear Algebra

Multivariate Calculus

Calculus of Variations

Numerical Methods for Ordinary Differential Equations

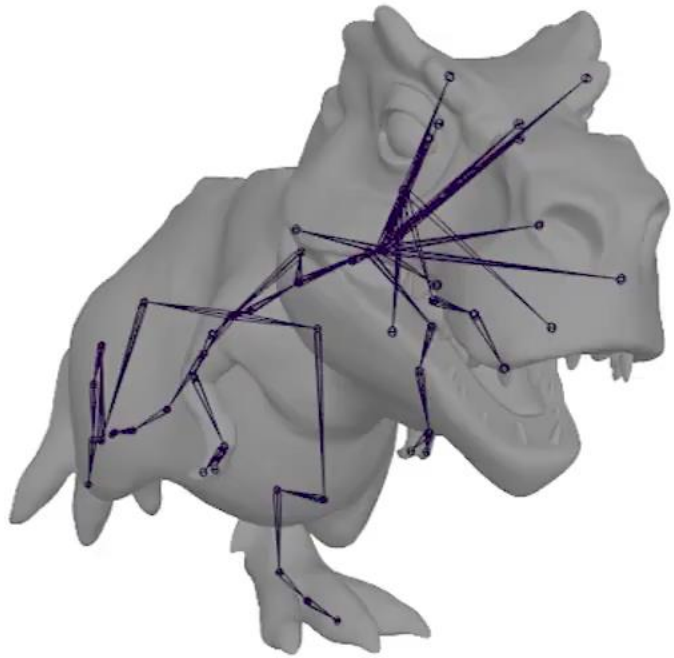

Numerical Methods for Partial Differential Equations

Optimization

**DON'T  
PANIC**

**Input**

**Output**

# Administrivia

Course web site (includes course information sheet):

<https://github.com/dilevin/CSC417-physics-based-animation>

## Instructor:

Prof. David I.W. Levin [diwlevin@cs.toronto.edu](mailto:diwlevin@cs.toronto.edu)

## TAs:

Shukai Chen

Jonathan Panuelos

João Pedro Vasconcelos Teixeira

*TA + Instructor Email:* [csc417tas@cs.toronto.edu](mailto:csc417tas@cs.toronto.edu)

## Lectures

---

Wednesday 11:00-13:00 [ES](#) B142

## Tutorials

---

Monday 11:00-noon (starts September 8th) **I will run the tutorials**

# Administrivia

Discussion Board

*<https://piazza.com/utoronto.ca/fall2025/csc417>*

Assignments will be submitted via MarkUs

*Coming Soon*

Academic Honesty section of webpage is required reading for the course

Highlights: You can use CoPilot, ChatGPT, Cursor and similar AI tools on assignments

# All New Course This Year

Dates	Topic	Assignments
9/3/2025	Introduction	
9/10/2025	Deformation and Finite Element Method	
9/17/2025	From Energy to Motion	
9/24/2025	Cloth Simulation	Release A1: Finite Element Methods
10/1/2025	Rigid Bodies / Affine Body Dynamics	
10/8/2025	Collisions	
10/15/2025	Intro to Fluid Simulation	Assignment 1 Due, Release A2: Affine Body Dynamics
10/22/2025	Material Point Method	
11/5/2025	Reduced-Order Models	Assignment 2 Due, Release A3: Fluids
11/11/2025	<b><i>Drop Deadline</i></b>	
11/12/2025	Fast Physics Solvers	Assignment 3 Due, Release A4: Reduced/Fast Methods
11/19/2025	Beyond Elasticity	
11/26/2025	<b><i>Final Exam</i></b>	Assignment 4 Due

# Grading

---

%	Item
50%	Assignments
30%	In-Tutorial Quizzes
20%	Final Exam (must get $\geq 50\%$ to pass course)

Details on quizzes are coming soon

# Lateness Policy

---

Please read, this course has an involved late policy aimed at giving you maximum flexibility in scheduling your semester

Assignments are ***due by 11:59pm*** on the three due dates below.

Every student will receive 21 "late days" that will be automatically applied before the late penalty begins to accumulate. You only have to inform the instructor if you **DO NOT** wish to use your late days for a particular assignment.

After late days have been exhausted, assignments accrue a penalty at the following rate: 0.007% off for every minute late.

Further extensions can only be issued by the instructor.

## **AI Policy**

You can freely use AI tools such as CoPilot, ChatGPT or Cursor for your assignments but not for quizzes or the final exam.

Let's Gooooooo!

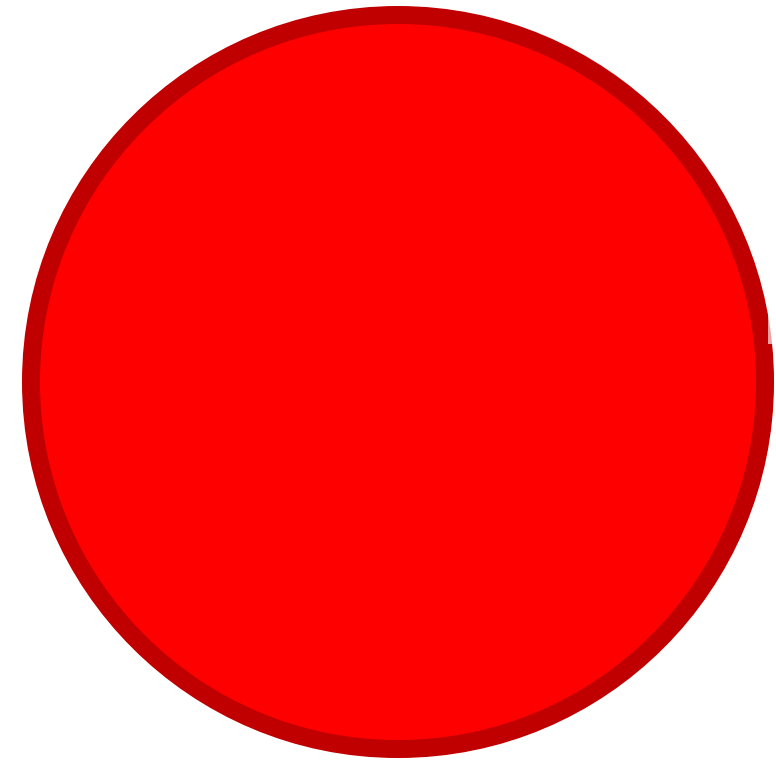

# Newton's Laws

1. Every object will remain at rest or in uniform motion in a straight line unless compelled to change its state by the action of an external force
2. The force acting on an object is equal to the time rate-of-change of the momentum
3. For every action there is an equal and opposite reaction

# Example Physical System

Particle

**Position in space (m)**

$$\mathbf{x}(t)$$

**Velocity in space (m/s)**

$$\mathbf{v}(t) = \frac{d\mathbf{x}}{dt}(t)$$

**Acceleration in space (m/s<sup>2</sup>)**

$$\mathbf{a}(t) = \frac{d^2\mathbf{x}}{dt^2}(t)$$

**Mass (kg)**

$$m$$

# Newton's Laws

1. Every object will remain at rest or in uniform motion in a straight line unless compelled to change its state by the action of an external force

2. The **force** acting on an object is equal to the **time rate-of-change of the momentum**

3. For every action there is an equal and opposite reaction

# Newton's Laws

momentum

$$\begin{array}{c} \text{velocity} \\ \downarrow \\ m\mathbf{v} \\ \uparrow \\ \text{mass} \end{array}$$

time rate-of-change of the momentum

force

$$\frac{d}{dt} (m\mathbf{v})$$

= **f**

for constant mass

$$\begin{array}{c} \text{acceleration} \\ \downarrow \\ m \frac{d\mathbf{v}}{dt} = \mathbf{f} \end{array}$$

Newton's Laws

momentum

velocity  
↓  
 $m\mathbf{v}$   
↑  
mass

time rate-of-change of the momentum = force

# Vectorial Mechanics

$$\frac{d}{dt}(m\mathbf{v}) = \mathbf{f}$$

for constant mass

acceleration  
↑  
 $m \frac{d\mathbf{v}}{dt} = \mathbf{f}$

# Variational Mechanics

*or Analytical Mechanics*

Based on two fundamental energies rather than two  
vectorial quantities

# Kinetic and Potential Energy

Kinetic Energy: Energy due to motion

Potential Energy: Energy “held within” an object due to its position, internal stresses, electrical charge etc ...

Potential energy has the *potential* to become kinetic energy

# Kinetic and Potential Energy

Potential Energy from Gravity

$$m \cdot g \cdot h$$

↑

acceleration due to gravity

# Kinetic and Potential Energy

Potential Energy from Gravity

$$m \cdot g \cdot h$$

↑

height above ground

# Variational Mechanics

Also called "Analytical Mechanics"

Based on two fundamental energies rather than two vectorial quantities

Motion defined using a variational principle

$$\begin{array}{ccc} & \text{functions of time and derivatives} & \\ & \text{-----} & \\ e & \left( \mathbf{f}(t), \dot{\mathbf{f}}(t), \dots \right) & \rightarrow \mathbb{R} \\ \uparrow & & \uparrow \\ \text{functional} & & \text{real numbers} \end{array}$$

# Generalized Coordinates

$$\mathbf{x}(t) = \mathbf{f}(\mathbf{q}(t))$$

generalized coordinates

Jacobian (lots of things are going to get called Jacobians)

$$\frac{d\mathbf{x}}{dt}(t) = \frac{d\mathbf{f}}{d\mathbf{q}} \dot{\mathbf{q}}(t)$$

generalized velocity

# Generalized Coordinates

$$\mathbf{x}(t) = \mathbf{f}(\mathbf{q}(t))$$

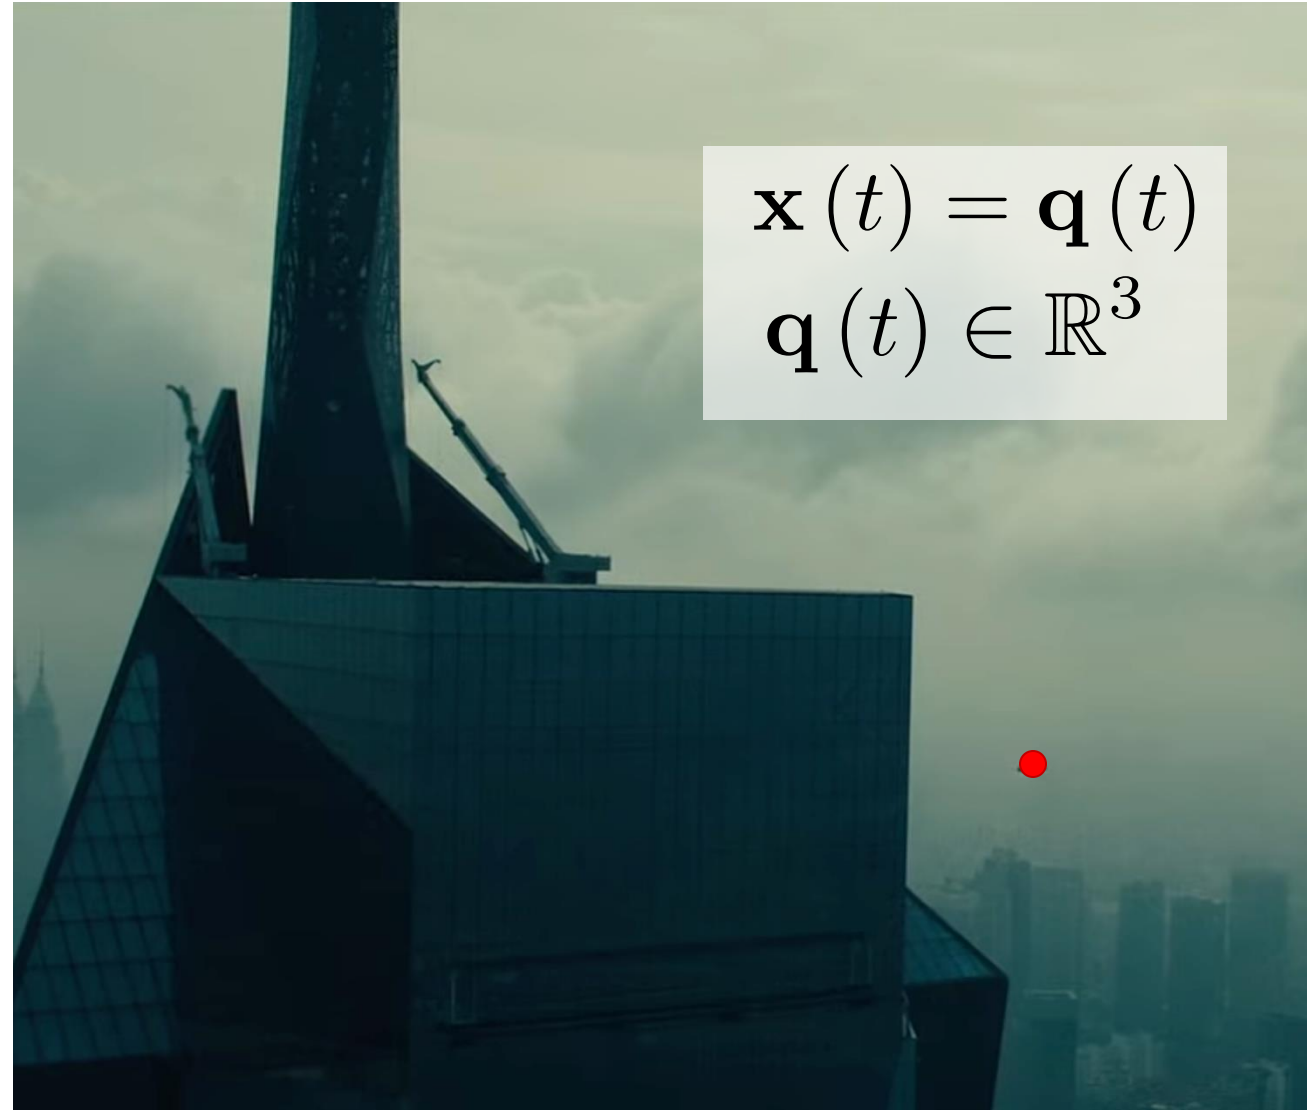

generalized coordinates

Jacobian

$$\frac{d\mathbf{x}}{dt}(t) = \frac{d\mathbf{f}}{d\mathbf{q}} \dot{\mathbf{q}}(t)$$

generalized velocity

$$\mathbf{x}(t) = \mathbf{q}(t)$$
$$\mathbf{q}(t) \in \mathbb{R}^3$$

Particle Florence

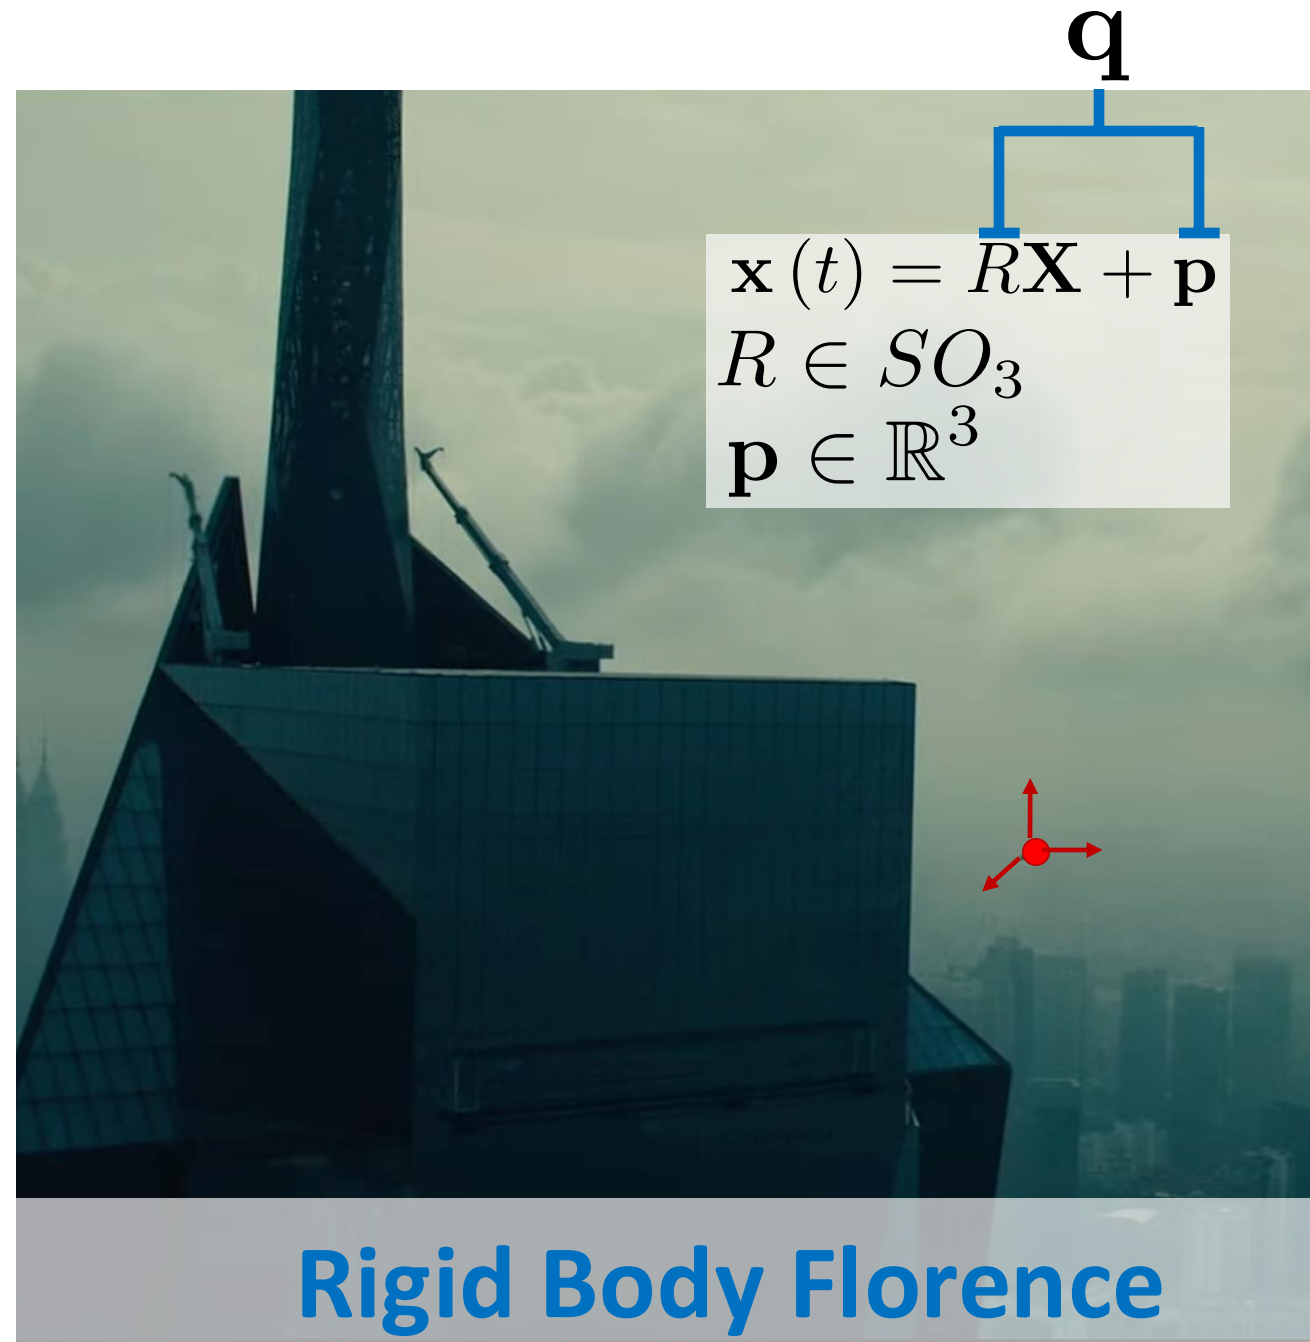

# Generalized Coordinates

$$\mathbf{x}(t) = \mathbf{f}(\mathbf{q}(t))$$

generalized coordinates

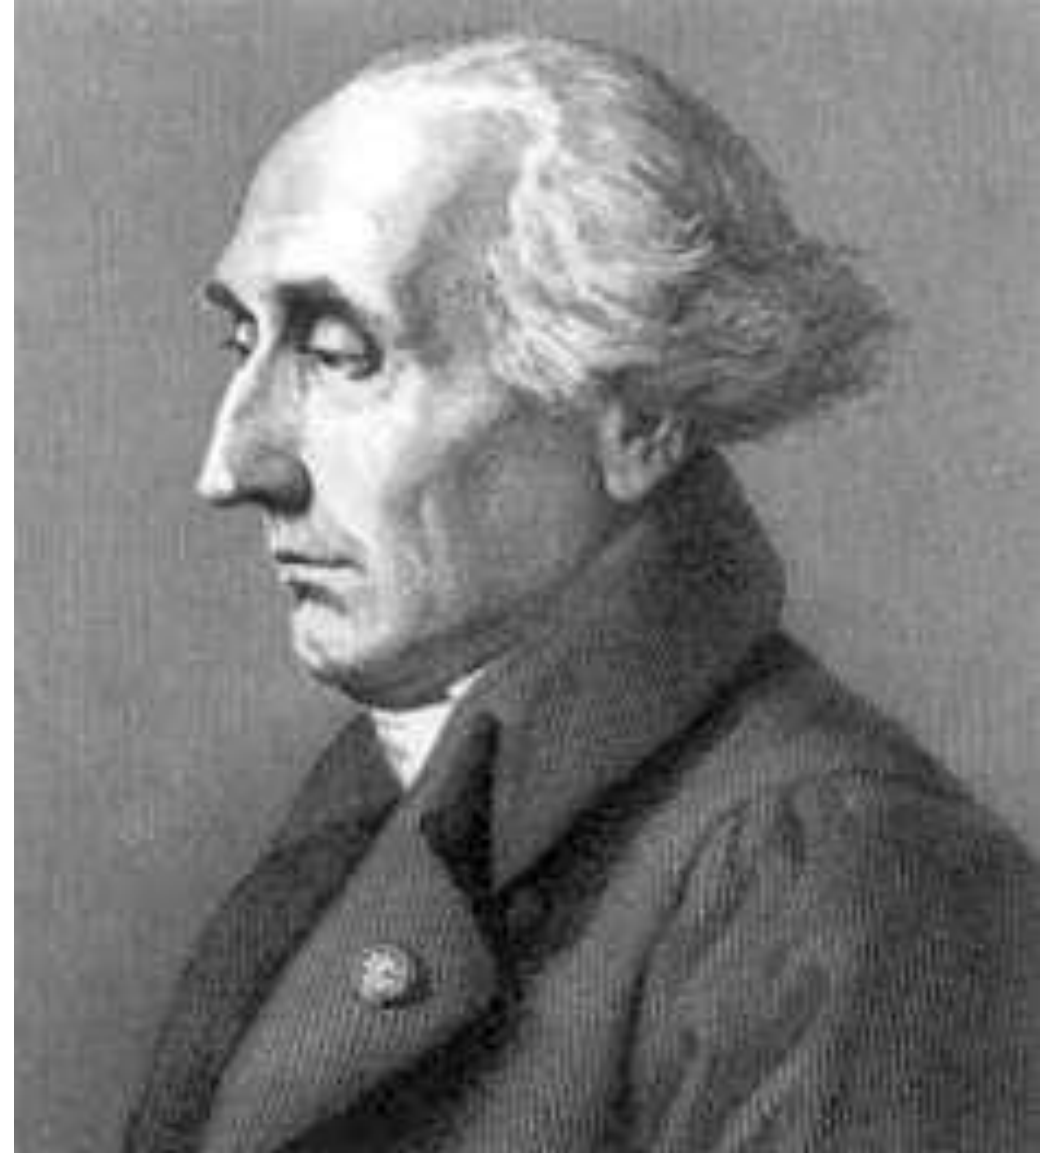

$$\frac{d\mathbf{x}}{dt}(t) = \frac{d\mathbf{f}}{d\mathbf{q}} \dot{\mathbf{q}}(t)$$

generalized velocity

# The Lagrangian

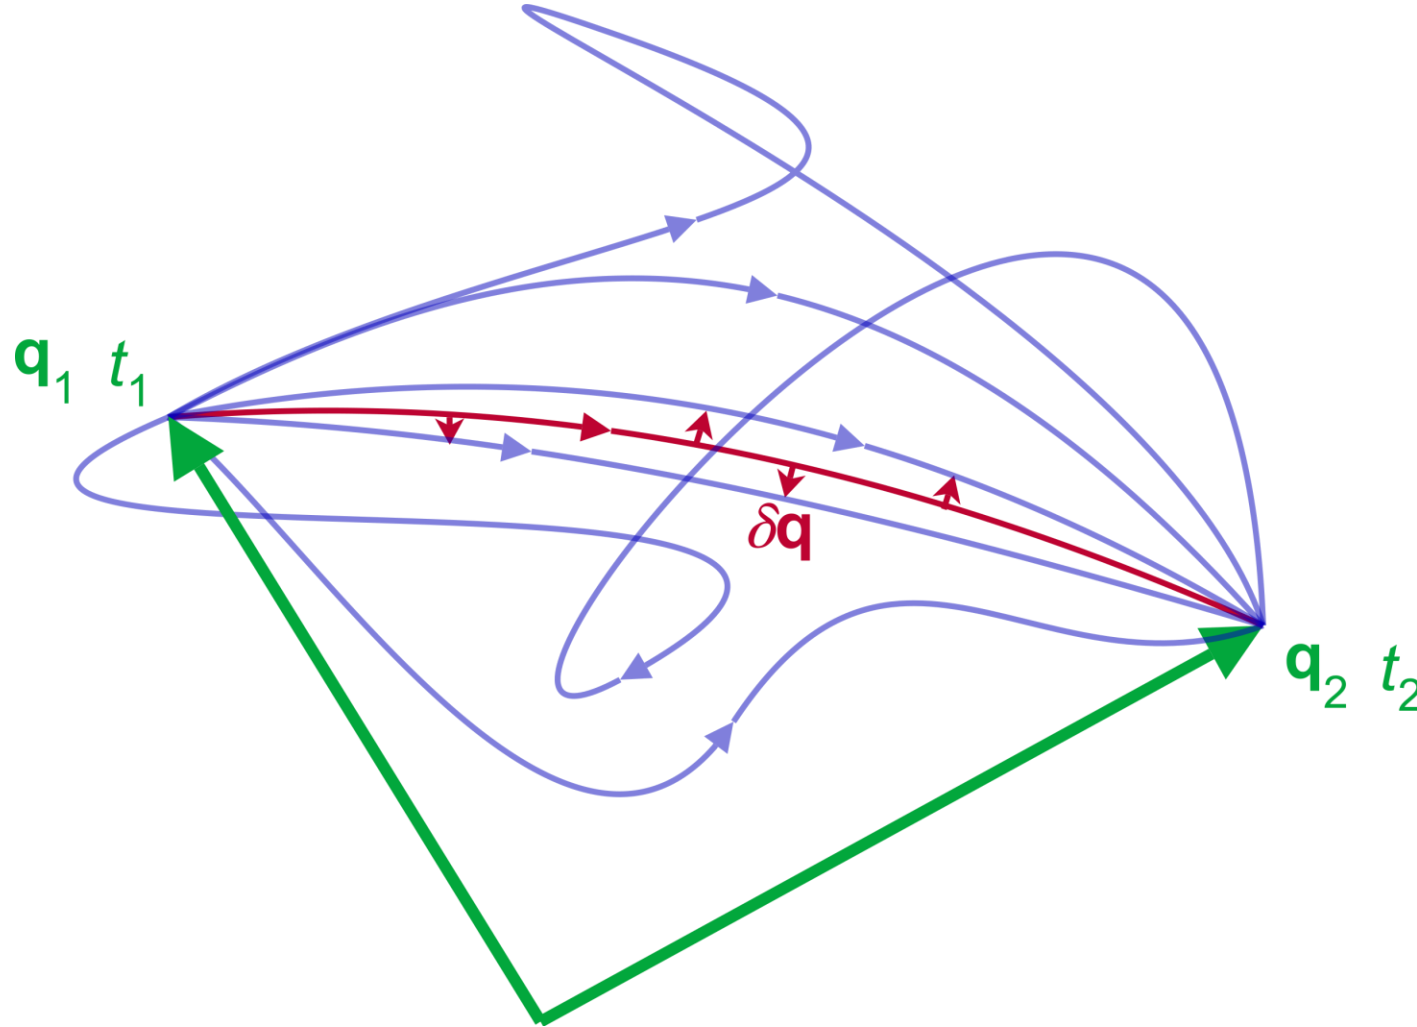

$$L = \underset{\text{Kinetic Energy}}{\underset{\text{⏟}}{T}} - \overset{\text{Potential Energy}}{\overset{\text{⏟}}{V}}$$

Joseph-Louis Lagrange  
(was pretty good at math)

# The Principle of Least Action

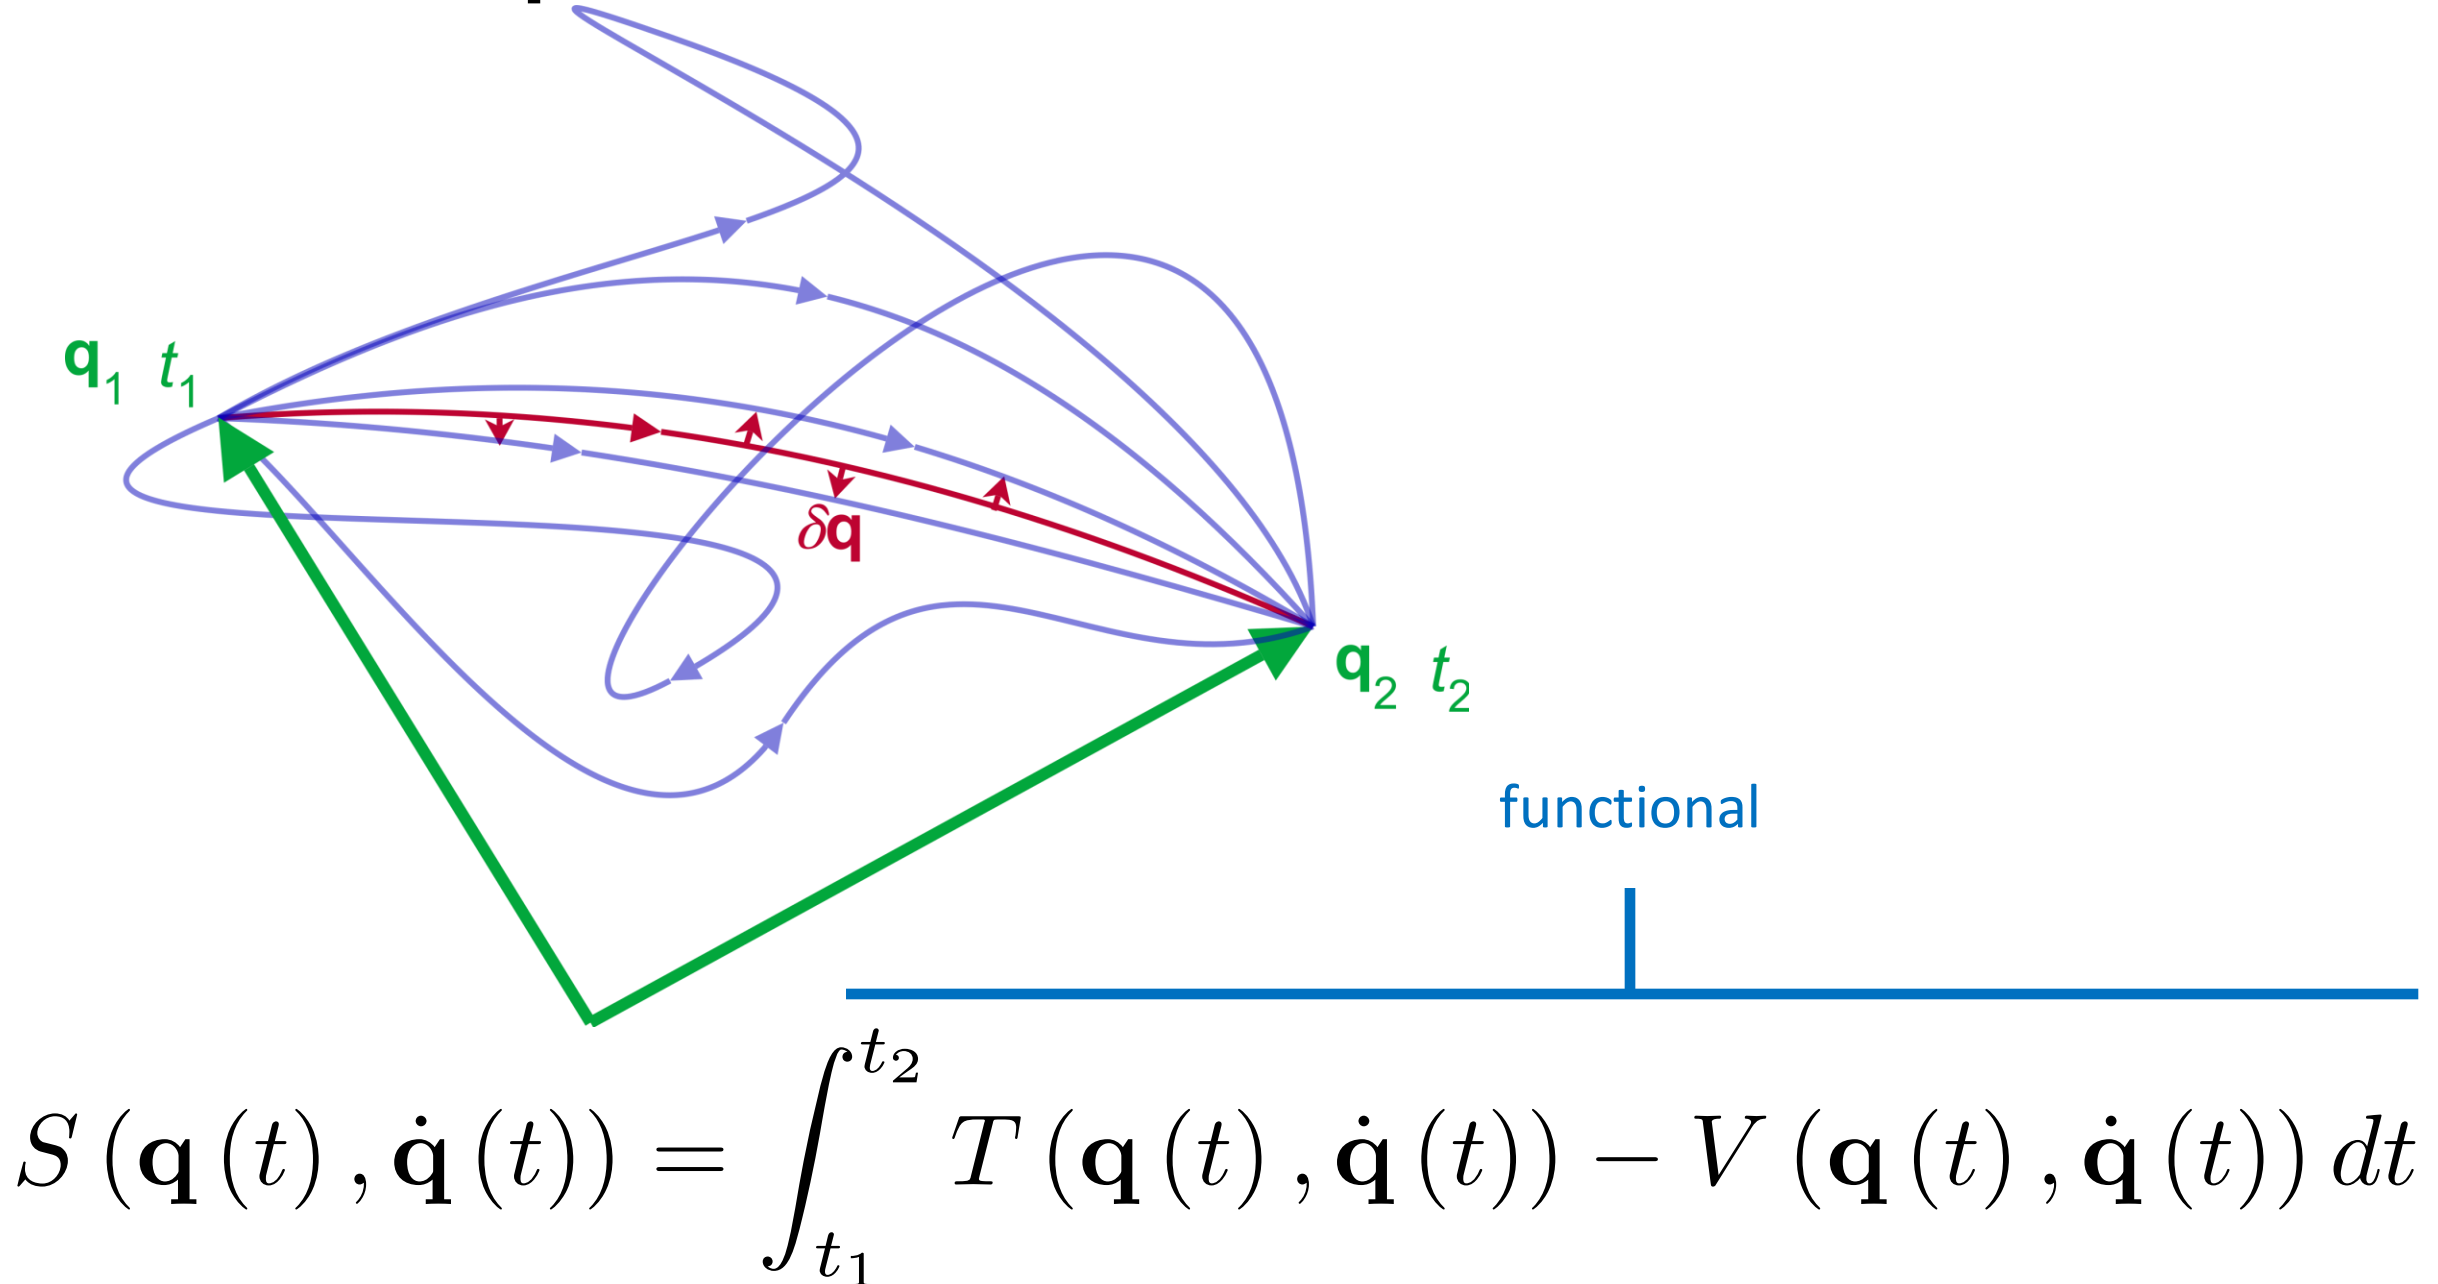

Assume you know the end points, find the path between them by finding a stationary point of the **ACTION**

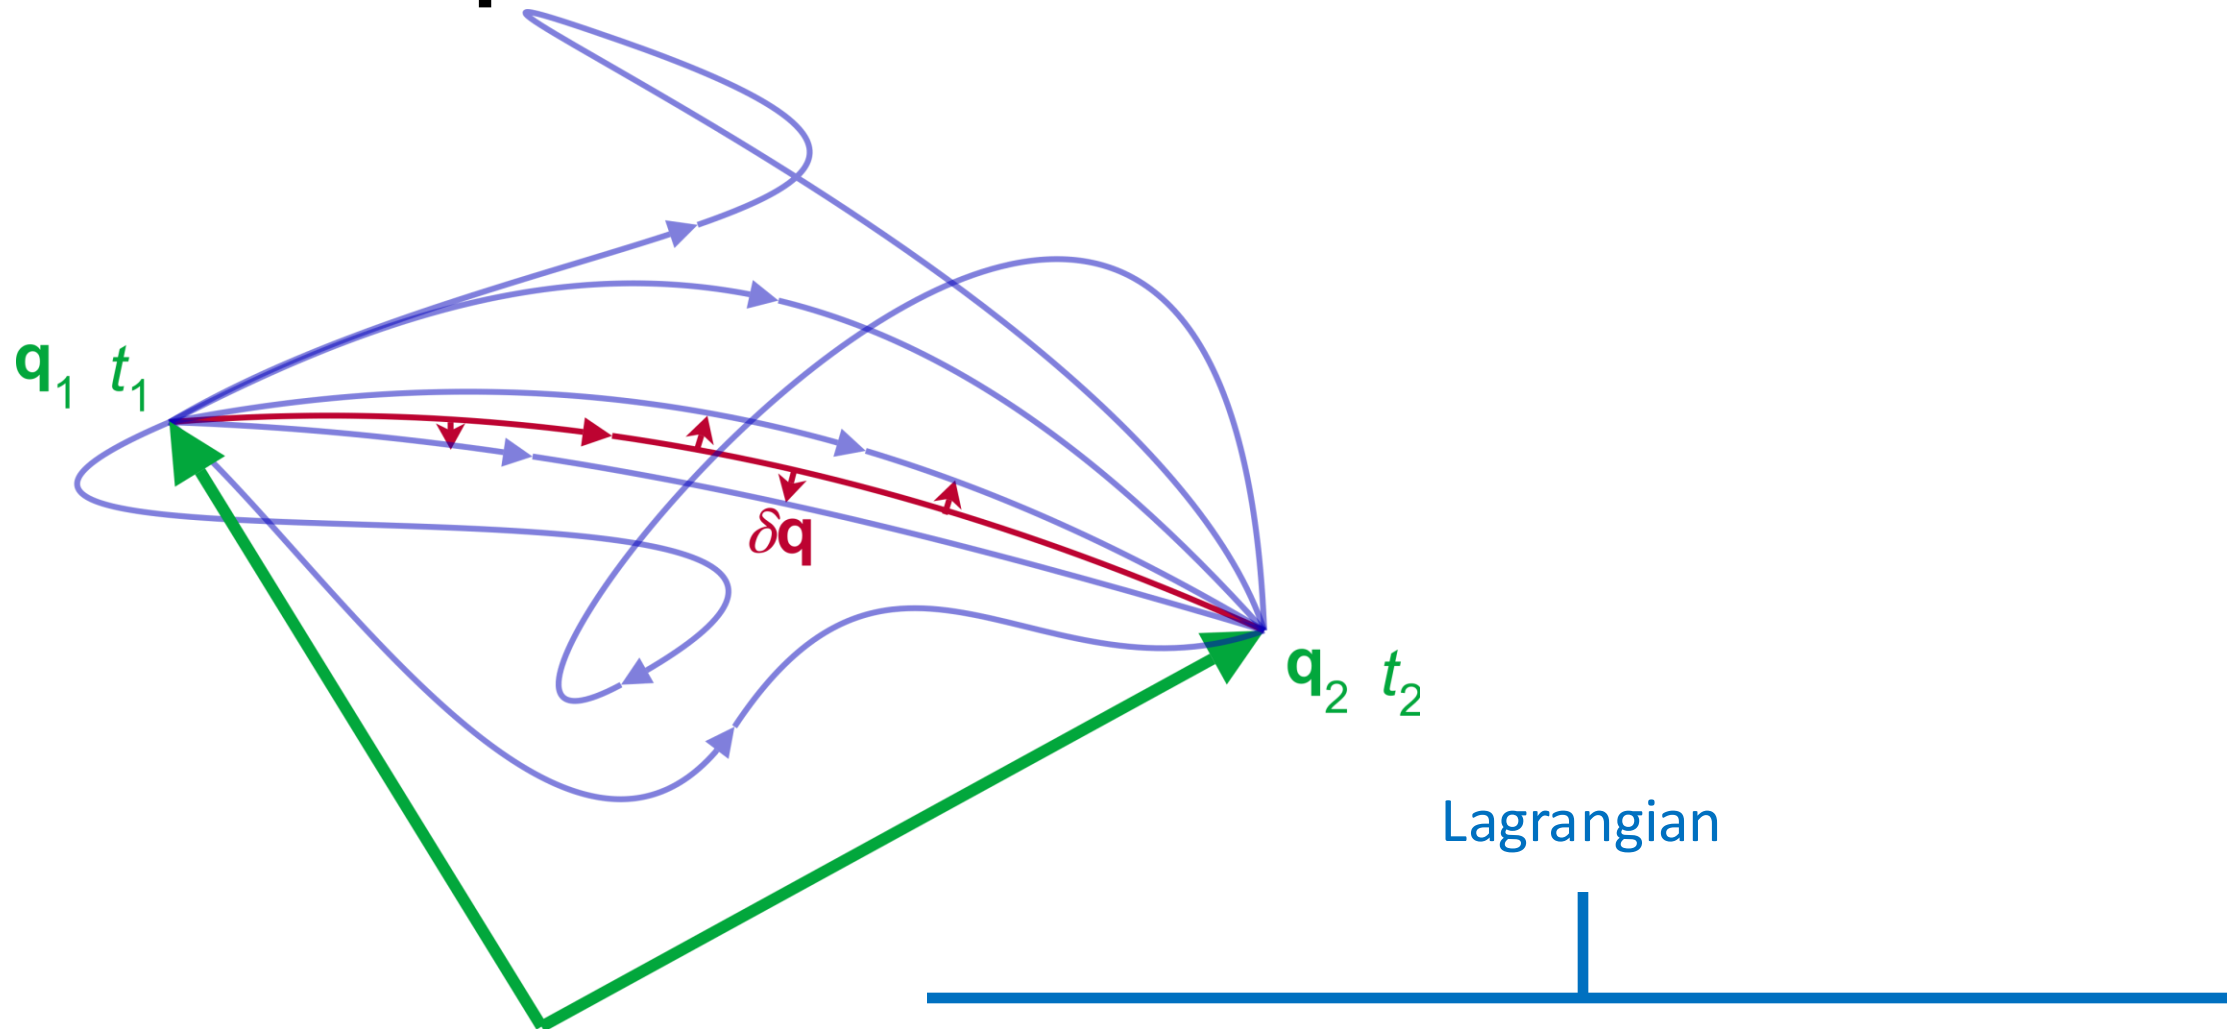

Gottfried Wilhelm Leibniz  
(was pretty good at math)

# The Principle of Least Action

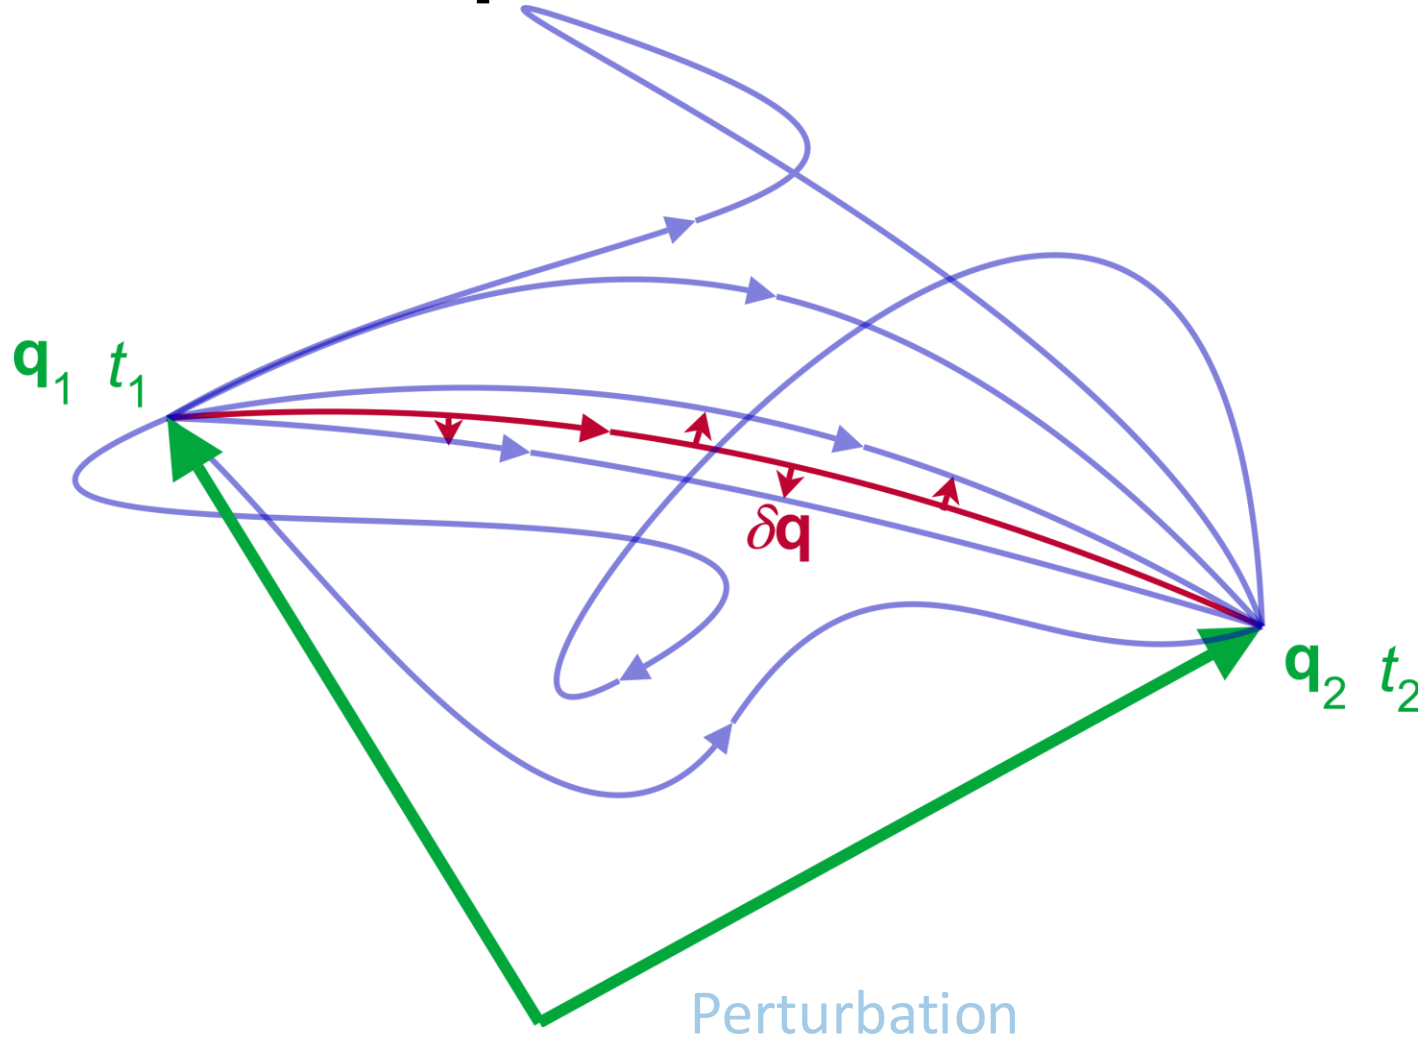

# The Principle of Least Action

$$S(\mathbf{q}(t), \dot{\mathbf{q}}(t)) = \int_{t_1}^{t_2} T(\mathbf{q}(t), \dot{\mathbf{q}}(t)) - V(\mathbf{q}(t), \dot{\mathbf{q}}(t)) dt$$

# The Principle of Least Action

Minimize by finding a flat spot

Hunt for a flat spot by perturbing the trajectory and seeing if  $S$  changes.

$$S(\mathbf{q} + \delta \mathbf{q}, \dot{\mathbf{q}} + \delta \dot{\mathbf{q}}) = S(\mathbf{q}(t), \dot{\mathbf{q}}(t))$$

# The Calculus of Variations

$$S(\mathbf{q}(t), \dot{\mathbf{q}}(t)) = \int_{t_1}^{t_2} L(\mathbf{q}(t), \dot{\mathbf{q}}(t)) dt$$

$$S(\mathbf{q} + \delta\mathbf{q}, \dot{\mathbf{q}} + \delta\dot{\mathbf{q}}) = \int_{t_1}^{t_2} L(\mathbf{q} + \delta\mathbf{q}, \dot{\mathbf{q}} + \delta\dot{\mathbf{q}}) dt$$

Apply Taylor Expansion

$$\approx \int_{t_1}^{t_2} L(\mathbf{q}, \dot{\mathbf{q}}) dt + \int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta\mathbf{q} + \frac{\partial L}{\partial \dot{\mathbf{q}}} \delta\dot{\mathbf{q}} dt$$

---

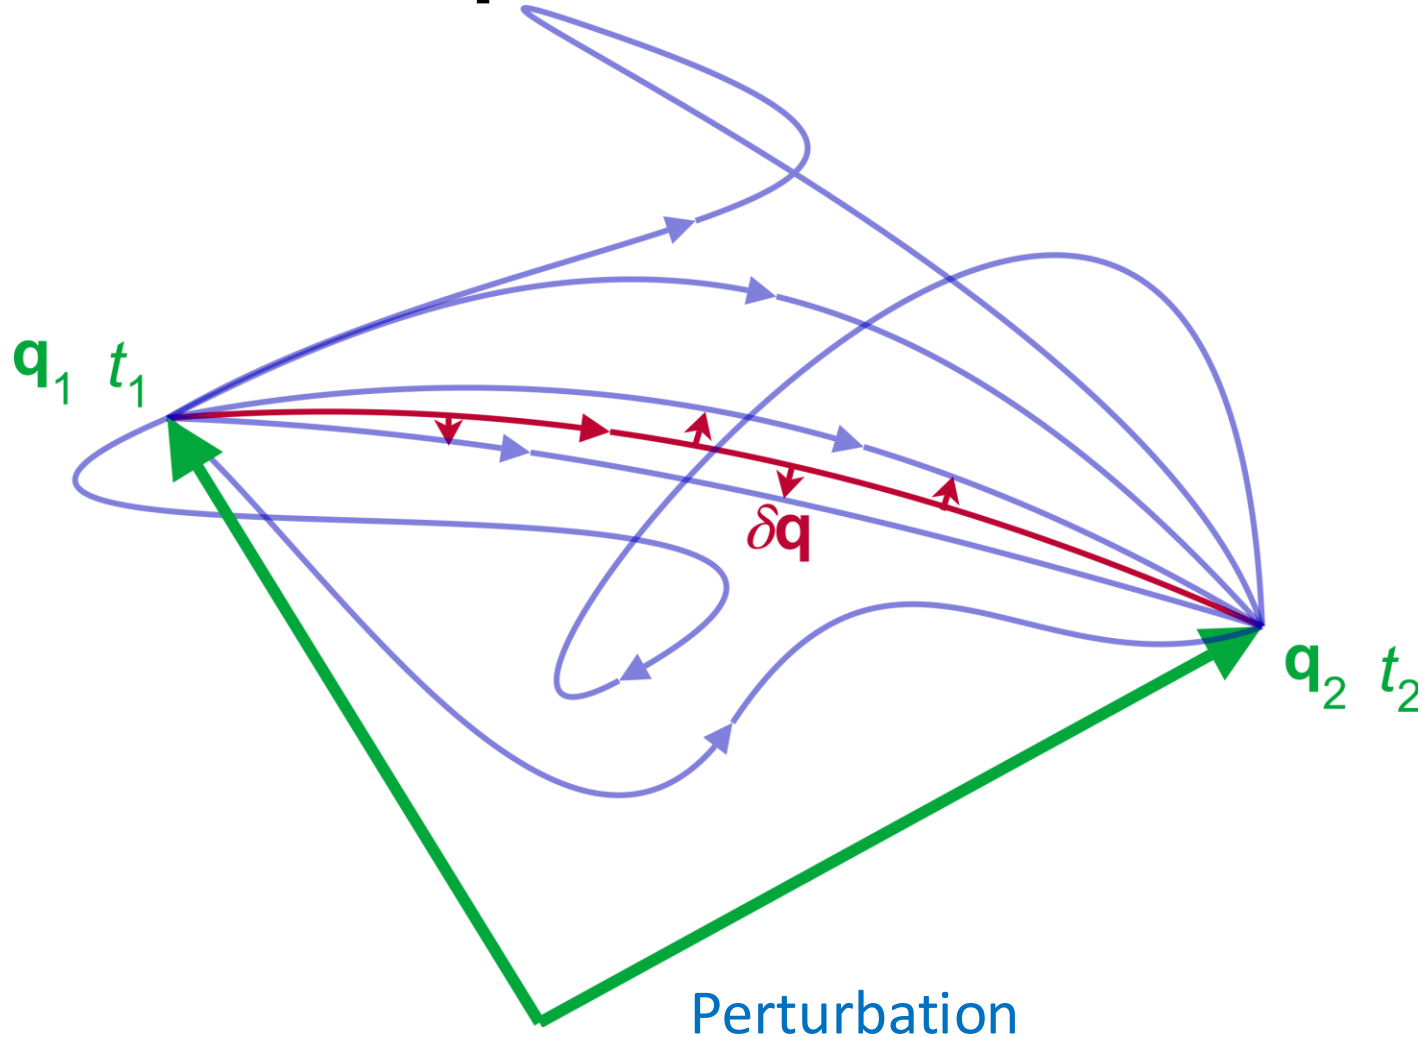

$$S(\mathbf{q}(t), \dot{\mathbf{q}}(t))$$

---

$$\delta S(\mathbf{q}(t), \dot{\mathbf{q}}(t))$$

First Variation

# The Principle of Least Action

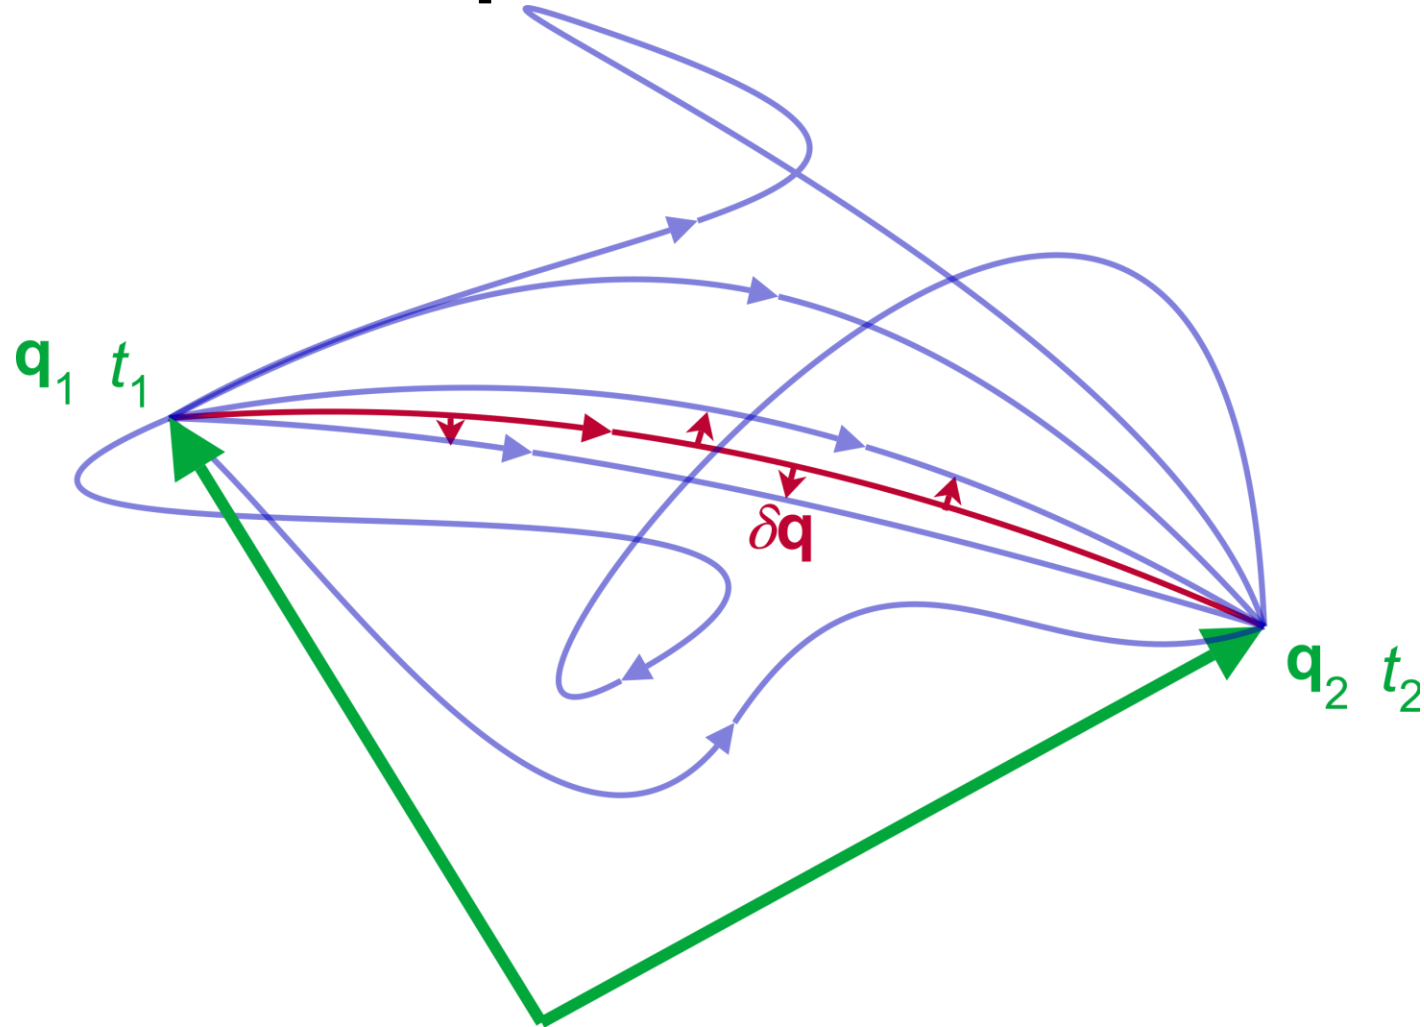

Minimize by finding a flat spot

Hunt for a flat spot by perturbing the trajectory and seeing if  $S$  changes.

$$S(\mathbf{q} + \delta \mathbf{q}, \dot{\mathbf{q}} + \delta \dot{\mathbf{q}}) = S(\mathbf{q}(t), \dot{\mathbf{q}}(t))$$

# The Principle of Least Action

Minimize by finding a flat spot

Hunt for a flat spot by perturbing the trajectory and seeing if  $S$  changes.

$$\delta S (\mathbf{q} (t) , \dot{\mathbf{q}} (t)) = 0$$

# Back to the Calculus of Variations

$$\int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta \mathbf{q} + \underbrace{\frac{\partial L}{\partial \dot{\mathbf{q}}}}_{\text{Apply Integration by Parts}} \delta \dot{\mathbf{q}} dt = 0$$

Apply Integration by Parts

$$\int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta \mathbf{q} - \frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \delta \mathbf{q} dt + \underbrace{\frac{\partial L}{\partial \dot{\mathbf{q}}} \delta \mathbf{q}}_{\text{Uh Oh, Boundary Conditions}} \bigg|_{t_0}^{t_1} = 0$$

Uh Oh, Boundary Conditions

**DON'T PANIC:** Remember that **you know the end points**, so the variation there is 0.

# Back to the Calculus of Variations

$$\int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta \mathbf{q} + \underbrace{\frac{\partial L}{\partial \dot{\mathbf{q}}}}_{\text{Apply Integration by Parts}} \delta \dot{\mathbf{q}} dt = 0$$

Apply Integration by Parts

$$\int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta \mathbf{q} - \frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \delta \mathbf{q} dt - \underbrace{\left. \frac{\partial L}{\partial \dot{\mathbf{q}}} \delta \mathbf{q} \right|_{t_1}^{t_2}}_{\text{Uh Oh, Boundary Conditions}} = 0$$

Uh Oh, Boundary Conditions

**DON'T PANIC:** Remember that **you know the end points**, so the variation there is 0.

# Back to the Calculus of Variations

$$\int_{t_1}^{t_2} \frac{\partial L}{\partial \mathbf{q}} \delta \mathbf{q} - \frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \delta \mathbf{q} dt = 0$$

A little bit o' factoring

$$\int_{t_1}^{t_2} \left( \frac{\partial L}{\partial \mathbf{q}} - \frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} \right) \delta \mathbf{q} dt = 0$$

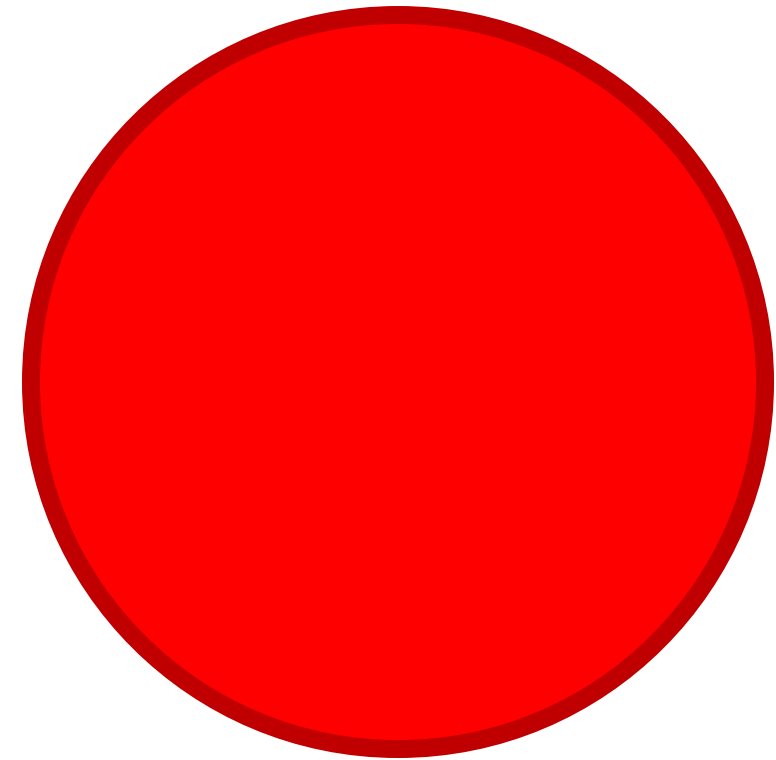

Say the magic words -- "If  $\delta \mathbf{q}$  is an arbitrary variation then the integrand must always be zero"

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} = \frac{\partial L}{\partial \mathbf{q}}$$

# Euler-Lagrange Equation

$$\frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} = \frac{\partial L}{\partial \mathbf{q}}$$

# Example Physical System

Particle

**Position in space (m)**

$$\mathbf{x}(t)$$

**Velocity in space (m/s)**

$$\mathbf{v}(t) = \frac{d\mathbf{x}}{dt}(t)$$

**Acceleration in space (m/s<sup>2</sup>)**

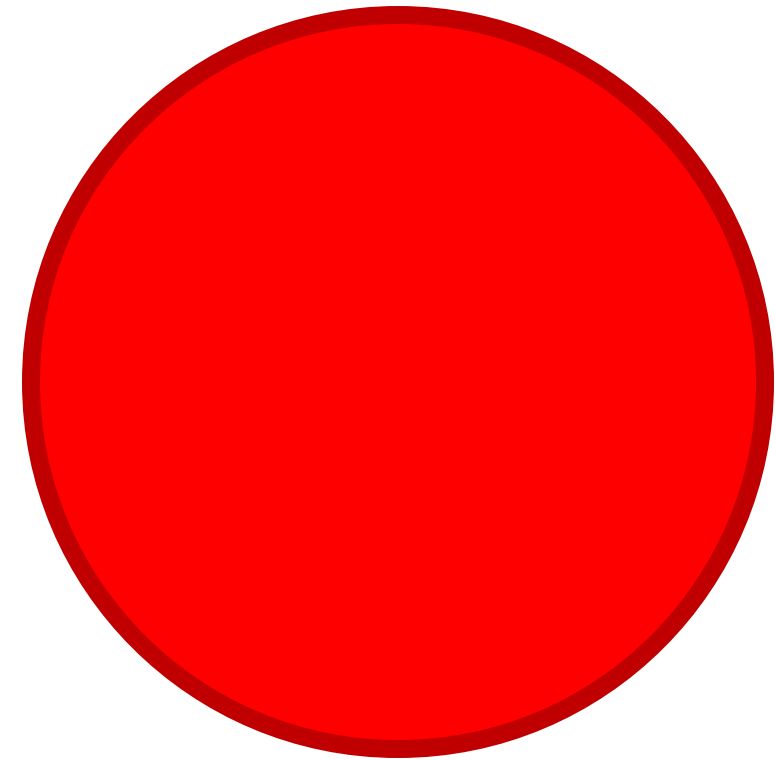

$$\mathbf{a}(t) = \frac{d^2\mathbf{x}}{dt^2}(t)$$

**Mass (kg)**

$$m$$

# Example Physical System

Particle

**Position in space (m)**  $\mathbf{q}(t) = \mathbf{x}(t)$

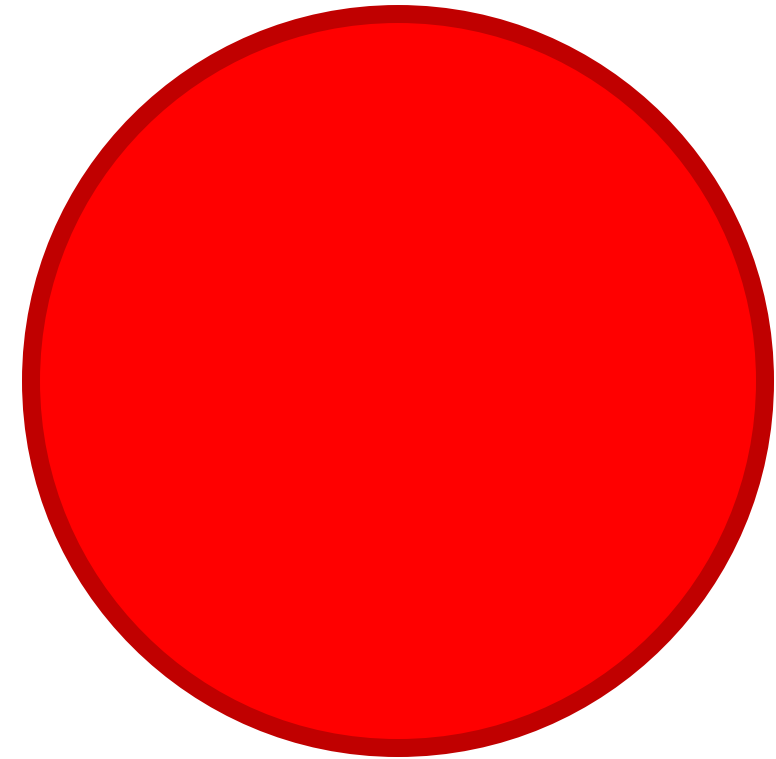

**Velocity in space (m/s)**  $\dot{\mathbf{q}}(t) = \mathbf{v}(t) = \frac{d\mathbf{x}}{dt}(t)$

**Acceleration (m/s<sup>2</sup>)**  $\ddot{\mathbf{q}}(t) = \mathbf{a}(t) = \frac{d^2\mathbf{x}}{dt^2}(t)$

**Mass (kg)**

$m$

# Energies

Particle

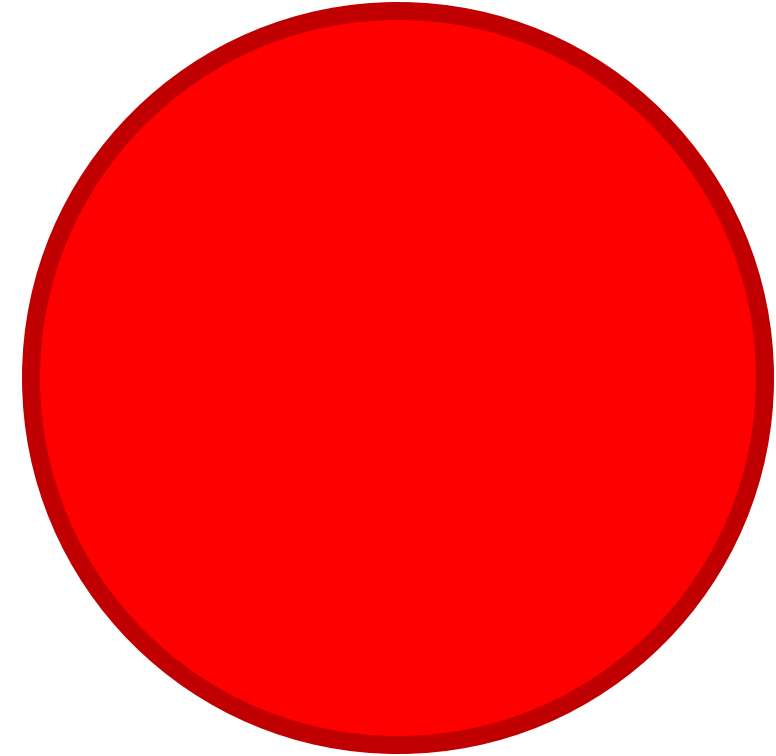

$$\text{Kinetic Energy} = \frac{1}{2} m \dot{\mathbf{q}}^T \dot{\mathbf{q}}$$

$$\text{Potential Energy} = -m \mathbf{q}^T \mathbf{g}$$

Gravitational Acceleration

$$\begin{array}{ccc}
 \frac{d}{dt} \frac{\partial L}{\partial \dot{\mathbf{q}}} & = & \frac{\partial L}{\partial \mathbf{q}} \\
 \hline
 \frac{d}{dt} m \dot{\mathbf{q}} & & m \mathbf{g} \\
 \hline
 m \ddot{\mathbf{q}} & & 
 \end{array}$$

# Equations of Motion

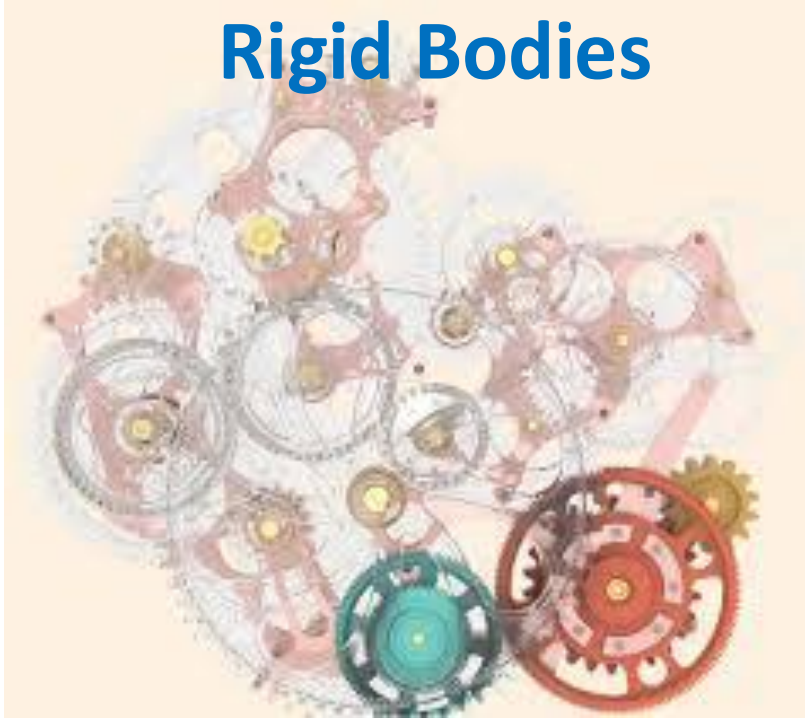

Particle

$$m\ddot{\mathbf{q}} = m\mathbf{g}$$

---

Newton's Second Law for Particle  
Under Gravity

## Rigid Bodies

## Cloth

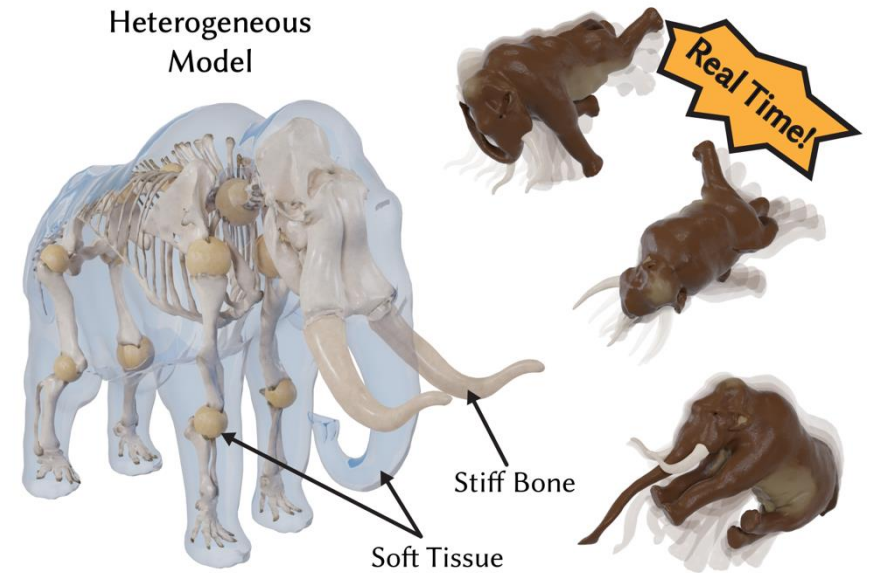

## Volumes

## Reduced-Order

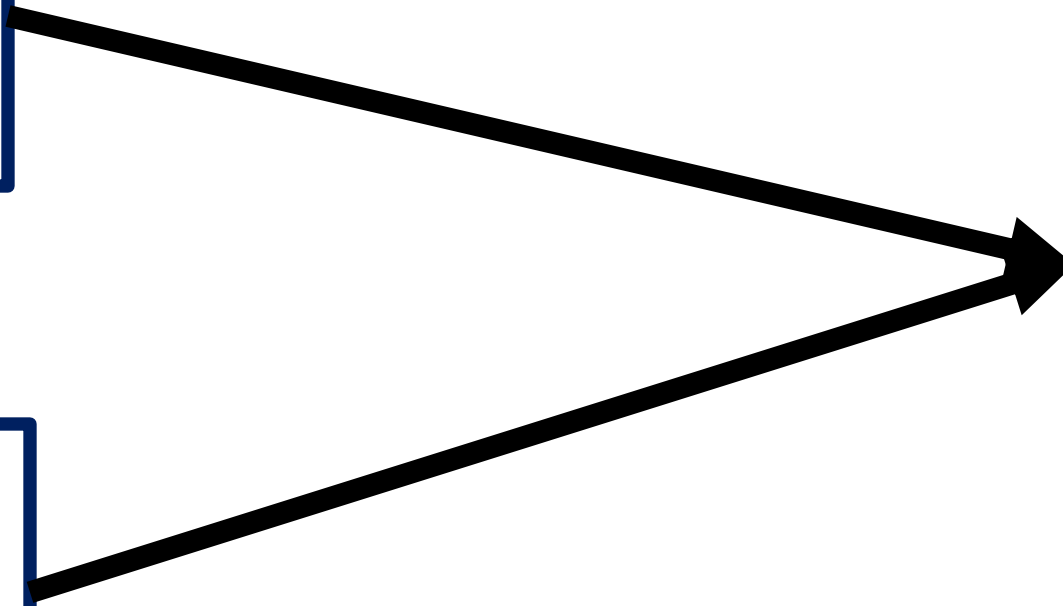

Heterogeneous  
Model

**Kinetic Energy**

**Potential Energy**

**Euler-Lagrange**

## Correct Equation

$$m\ddot{\mathbf{q}} = m\mathbf{g}$$

How does this become  
an animation?

**Kinetic Energy**

```
graph LR; KE[Kinetic Energy] --> EL[Euler-Lagrange]; PE[Potential Energy] --> EL; EL --> TI[Time Integration]
```

**Potential Energy**

**Euler-Lagrange**

**Time Integration**
